As a student at McMaster's iBioMed program, I'm currently taking a year-long course about entrepreneurship in biomedical innovation. A highlight of this course is the end-of-term investigation, centered upon proposing a therapeutic for Osteoporosis by targeting a specific cellular pathway. In developing this investigation, I've gained valuable research skills, including the ability to synthesize knowledge across multiple primary research articles, understand data that is presented in a variety of forms and their significance, and create scientific renders of biological mechanisms (attached below). I'm excited to continue developing my research skills in the coming years!
